                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                negative homozygous individuals. The specification describes an immunogenic peptide constituting a T-cell epitope, obtainable from the minor histocompatibility antigen HA-1. The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce tolerance for transplants so as to prevent rejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases. Neoplastic haematopoietic cells presenting the peptides, in an HIA class I context, can be eliminated after specific recognition of the peptides. The peptides can also be used to raise antibodies, T-cell receptor, B- and T-cells
The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAW97375 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WO9905313-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Intron; minor histocompatibility antigen HA-1; typing allele; H allele; R allele; polymorphic nucleotide; HA-1 typing; bone marrow transplant; severe aplastic anaemia; leukaemia; immune deficiency disease; 85.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13-MAY-1999
                                                                                                                                                                                                                                                  The present sequence represents part of the minor histocompatibility antigen HA-1 H-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Typing minor histocompatibility antigen HA-1 - by amplifying and identifying HA-1 R and HA-1 H alleles of HA-1, used for, e.g. detection of genetic aberrances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homo sapiens

                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel method for providing epitopes of allelic CC variants of antigenic proteins from specific species based on single CC nucleotide polymorphism (SNP), by defining target protein/peptide or its subset, screening database of DNA encoding target protein flentifying, CC selecting allelic peptide/protein variants, expression product or its CC fragment encoded by DNA sequence having SNP, creating variant epitopes, CC selecting epitopes binding to MHC protein. A protein of the invention has CC cytostatic activity, and may have a use in a vaccine. The method is CC given species by applying the method for several protein from the CC individuals, where the SNP profile of one or more individuals from the CC cancer. This is useful for diagnosing a disease in an individual by cancer. This is useful for diagnosing a disease in an individual by cancer. This is useful for diagnosing a disease in an individual by cancer. This is useful for diagnosing a disease in an individual by cancer. This is useful for diagnosing a disease in an individual by cancer in the superior profile. A method of the invention is useful for transplanting haematopoietic stem cells from a donor to a superior to a server of the progression, regression or onset of a treated disease. The present considerable is used in the exemplification of the invention.
                                                                                                                                                                       밁

The peptide is immunogenic and can be used as part of a vaccine. Pl is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency diseases. The present sequence represents a KIAA0223 sequence given in

The specification describes an immunogenic peptide constituting a T-cell epitope, obtainable from the minor histocompatibility antigen HA-1. The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce tolerance for transplants so as to prevent rejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases. Neoplastic haematopoietic cells presenting the peptides, in an HIA class I context, can be eliminated after specific recognition of the peptides. The peptides can also be used to raise antibodies, T-cell receptor, B- and T-cells
             A new minor histocompatibility

The peptide is immunogenic and can be used as part of a vaccine. P1 is used as medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the particular it can be used with bone marrow transplantation, in the particular it can be used with bone marrow transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

                          The present sequence represents an immunogenic peptide constituting a T-cell epitope, obtainable from the minor histocompatibility antigen HA-1. The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce tolerance for transplants so as to prevent rejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases. Neoplastic haematopoietic cells presenting the peptides, in an HIA class I context, can be eliminated after specific recognition of the peptides.

                                                                          CC encoding 11 separate viral proteins: non-structural proteins NS-1 (also CC known as the 1C protein) & NS-2 (1B protein), a polymerase protein L and CC eight structural proteins preferably G, also M, M2-1, M2-2, N, P, F, and CC eight structural proteins preferably G, also M, M2-1, M2-2, N, P, F, and CC expressition comprising an above peptide mixed with a pharmaceutical CC expression vector with a nucleic acid insert encoding an above peptide. CC The present invention describes an in vitro method of detecting cytotoxic CC Tymphocytes (CTLs) that respond to a major histocompatibility complex CC (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The CC (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The CC (prophylactic or therapeutic) vaccine composition for a DNA-based CC immunisation, or for preparing an immune response provoking vaccine in CC the event of RSV infection (the vaccine being prepared by contacting the CC polypeptide in an immune response-provoking and activity. This cappide sequence is a human RSV high binding affinity peptide of the

                      Human respiratory syncytial virus
                                                                           human respiratory syncytial virus; cytotoxic T lymphocyte; CTL; MHC epitope; DNA-based immunisation; RSV infection; virucidal; vaccine.
                                                                                                                                                                                                                                                                       ADT73690;
                                                                                                                                                    Human RSV L high affinity binding peptide SeqID 1586.
                                                                                                                                                                                                               13-JAN-2005
                                                                                                                                                                                                                                                                                                                    ADT73690 standard; peptide; 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 9 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence from preserved region VI of prenyl diphosphate synthetase (PDS), was used in the preparation of primers for the amplification of PDS DNA. Substances synthesized by PDS, i.e. polyprenyl diphosphates, are precursors of physiologically active substances, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vitamin K and ubiquinones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding prenyl diphosphate synthetase subunit(s) - new Micrococcus prenyl diphosphate synthetase subunit polypeptide(s), and methods for

This invention relates to novel isolated or purified peptides of the CC human respiratory syncytial virus (RSV), in particular ten RSV genes CC encoding 11 separate viral proteins non-structural proteins NS-1 (also CC known as the 1C protein) & NS-2 (1B protein), a polymerase protein L and CC eight structural proteins preferably G, also M, M2-1, M2-2, N, P, F, and CC composition comprising an above peptide mixed with a pharmaceutical CC excipient or an RSV immunogenic composition comprising a recombinant CC expression vector with a nucleic acid insert encoding an above peptide. CC Tlymphocytes (CTLs) that respond to a major histocompatibility complex (CMHC) class I restricted T-cell stimulating peptide epitope of RSV. The CC RSV peptide is useful for preparing a diagnostic composition or an RSV immunisation, or for preparing an immune response provoking vaccine in the event of RSV infection (the vaccine being prepared by contacting the communisation for a fire-preparing an immune response provoking vaccine in the event of RSV infection (the vaccine being prepared by contacting the

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

Publication No. US20050031612A1

GENERAL INFORMATION:

APPLICANT: Goulmy, Elsa A.J.M.

TITLE OF INVENTION: Minor histocompatibility antigen HA-1: target antigen for immunor

TITLE OF INVENTION: of tumors

FILE REFERENCE: 2183-6479US

CURRENT APPLICATION NUMBER: US/10/861,335

CURRENT FILING DATE: 2004-06-04

PRIOR APPLICATION NUMBER: PCT/NL02/00791

PRIOR APPLICATION NUMBER: EB 01204704.9

PRIOR APPLICATION NUMBER: ED 01204704.9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NUMBER OF SEQ ID NOS: 17

XX Mino
XX M The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompactibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the
